

Heat Recovery Ventilator (HRV)

Minto homes are carefully designed and built to reduce air leakages, saving homeowners energy and money. However, in an airtight home, the indoor air eventually gets old and stale. The solution for this is the Heat Recovery Ventilator (HRV) unit, which ensures that the air inside is continually replaced with fresh air from outside. While keeping air streams separate, the HRV transfers the heat from the outgoing stale air to the incoming fresh air, keeping the efficiency of the overall system as high as possible and reducing energy costs.
